1.3.1 Scenario 1

Security breaches today are all too common, with attackers constantly finding new and innovative ways of infiltrating organizations in search of valuable information.

Scroll down to read the latest breaking security news headline.*

Answer: C

The correct answer to this scenario would be letter C as in the text provided, the hotel discovered that their customer database was infiltrated, and that within the massive data breach, the personal information of over three million guests were exposed to hackers (first paragraph).

1.3.2 What Happened?

According to our sources, a well known hotel chain that operates across the world has reported a massive data breach, with the personal information of over three million guests exposed to hackers.

The hotel discovered that hackers gained access to its customer database by using the login details of one of its employees.

At this point, the hotel doesn't believe that the hackers were able to access any account passwords or financial information. Recent guests are encouraged to check the hotel chain's web portal to see if they have been impacted by this breach.

*This is a fictional scenario.

In this example, what did the hackers take?

Select the correct answer, then Submit.

- ☐ The username and password of all of the hotel's employees
- ☐ The card payment information of over three million guests
- ☒ The names, email address and phone numbers of over three million hotel guests
- ☐ The hotel chain's reputation

1.3.3 Scenario 2

eLearning Platforms at Risk!

The team at @Apollo is concerned. eLearning platforms are becoming prime targets for attackers as more and more organizations make the move to digital learning.

Select the arrows to find out more about a recent case.*

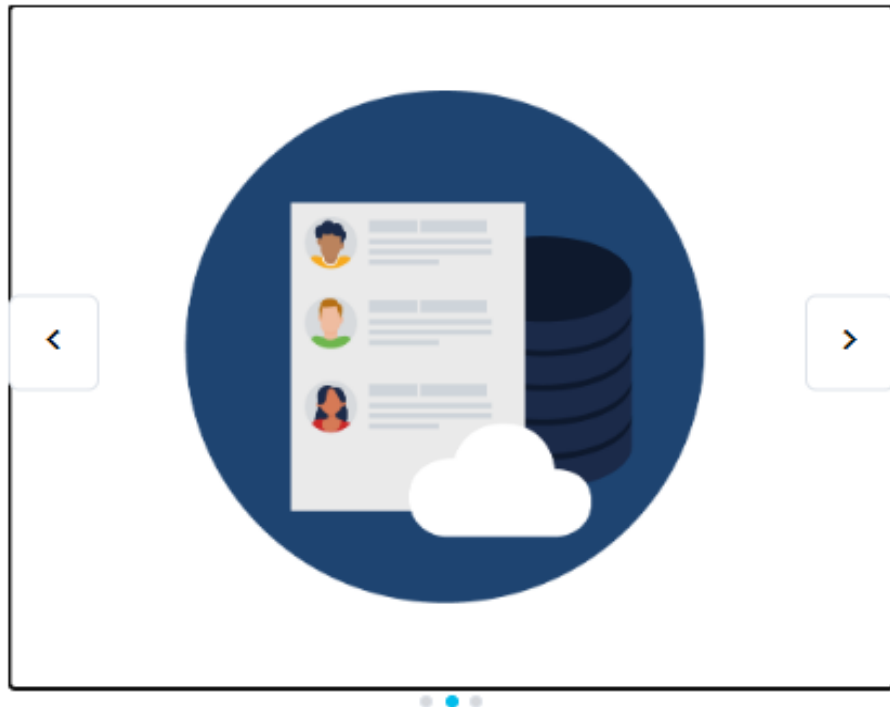

A popular online training platform admitted leaving the personal data of millions of its students (many of them minors) exposed on a publicly accessible cloud database.

1.3.3 Scenario 2

eLearning Platforms at Risk!

The team at @Apollo is concerned. eLearning platforms are becoming prime targets for attackers as more and more organizations make the move to digital learning.

Select the arrows to find out more about a recent case.*

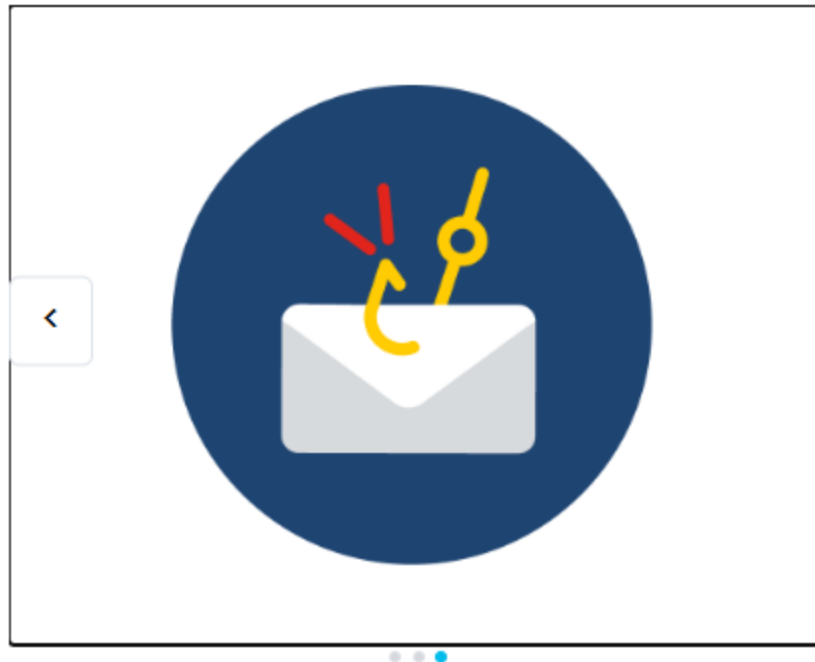

Hackers were able to directly access students' full names, email addresses, phone numbers, and school enrollment details from the Internet!

1.3.3 Scenario 2

eLearning Platforms at Risk!

The team at @Apollo is concerned. eLearning platforms are becoming prime targets for attackers as more and more organizations make the move to digital learning.

Select the arrows to find out more about a recent case.*

While it's unclear what the hackers have done with this acquired information, it's safe to say that they have everything they need to carry out widespread phishing or malware attacks.

Answer: C

The correct answer to this scenario would be letter C. Reading through the scenario, it explained that some kind of popular online learning program admitted to leaving millions of students' info exposed in their database. This points to a lack of security practices of the company and site.

1.3.4 What Exploits?

What exploits did the hackers use in this case to gain access to valuable personal information?

Select the correct answer, then Submit.

- ☐ Bypassing the platform's access control methods
- ☐ Taking advantage of student information not being correctly validated on the platform
- ☒ Weaknesses in the platform's security practices
- ☐ Extracting information when the volume of student data exceeds the storage capacity of the platform's memory buffer

Open-Ended

Taking in consideration both scenarios and their flaws, these organizations could definitely use more advanced security practices. They both were breached due to someone's login or information not being protected efficiently. Measures these organizations could've implemented was a 2 factor authentication, train their employees more on awareness, and also adding security patches, which significantly lowers the chances of hackers finding a exposed cloud database.
